### 4.1 Morse functions

**Definition 4.1.1.** Let  $M$  be a manifold. A *Morse function* is a smooth function  $f : M \rightarrow \mathbb{R}$  such that all critical points are nondegenerate.

**Proposition 4.1.1.** Let  $M$  be an embedded submanifold of  $\mathbb{R}^n$ . For almost every point  $p \in \mathbb{R}^n$ , the function  $f : M \rightarrow \mathbb{R} : x \mapsto \|x - p\|^2$  is Morse.

*Proof.* Suppose that  $p \in \mathbb{R}^n$  makes  $f$  be not Morse so that it possesses a degenerate critical point. Note that the notation  $x$  can denote not only a point variable on  $M$  but also the embedding map  $M \hookrightarrow \mathbb{R}^n$ . Let  $N \subset M \times \mathbb{R}^n$  be the normal bundle of the tangent bundle  $TM$  and define a map  $\varphi : N \rightarrow \mathbb{R}^n$  such that  $\varphi(x, y) = x + y$ . We claim that the point  $(x, p - x)$  is contained in  $N$  and  $\varphi$  is critical at this point if  $f$  is degenerate at  $x$ .

The differential of  $f$  is

$$df_x(v) = 2(x - p) \cdot dx(v) = 2(x - p) \cdot v,$$

so  $x$  is critical point if and only if  $x - p$  is proportional to  $T_x M$ .

Let  $\{x^i\}_{i=1}^m$  be orthonormal coordinates for  $M$  and let  $\{e_j\}_{j=1}^{n-m}$  be an orthonormal frame field of  $N$ . Define coordinate functions  $\{x^i, y^j\}$  on the manifold  $N$  by

$$x^i(x, y) := x^i(x), \quad \text{and} \quad y^j(x, y) := y \cdot e_j(x).$$

Then,

$$\left\{ \frac{\partial x}{\partial x^1}, \dots, \frac{\partial x}{\partial x^m}, \frac{\partial y}{\partial y^1}, \dots, \frac{\partial y}{\partial y^{n-m}} \right\}$$

always form an orthonormal basis on  $\mathbb{R}^n$  and

Since

$$\frac{\partial \varphi}{\partial x^i} = \frac{\partial x}{\partial x^i} + \frac{\partial y}{\partial x^i} \quad \text{and} \quad \frac{\partial \varphi}{\partial y^j} = \frac{\partial y}{\partial y^j},$$

we have

$$\begin{aligned} \frac{\partial \varphi}{\partial x^i} \cdot \frac{\partial x}{\partial x^k} &= \delta_{ik} - y \cdot \frac{\partial^2 x}{\partial x^i \partial x^k}, & \frac{\partial \varphi}{\partial x^i} \cdot \frac{\partial y}{\partial y^l} &= -y \cdot \frac{\partial^2 y}{\partial x^i \partial y^l}, \\ \frac{\partial \varphi}{\partial y^j} \cdot \frac{\partial x}{\partial x^k} &= 0, & \frac{\partial \varphi}{\partial y^j} \cdot \frac{\partial y}{\partial y^l} &= \delta_{jl}. \end{aligned}$$

To represent  $d\varphi(\partial_{x^1}, \dots, \partial_{y^{n-m}})$  with matrix, we can write

$$\begin{pmatrix} \frac{\partial \varphi}{\partial x^i} \\ \frac{\partial \varphi}{\partial y^j} \end{pmatrix} \begin{pmatrix} \frac{\partial x}{\partial x^k} & \frac{\partial y}{\partial y^l} \end{pmatrix} = \begin{pmatrix} \text{id} - y \cdot \frac{\partial^2 x}{\partial x^i \partial x^k} & -y \cdot \frac{\partial^2 y}{\partial x^i \partial y^l} \\ 0 & \text{id} \end{pmatrix}.$$

Then,

$$\frac{\partial^2 f}{\partial x^i \partial x^j} = 2 \left( \text{id} + (x - p) \cdot \frac{\partial^2 x}{\partial x^i \partial x^j} \right)$$

deduces that  $d\varphi$  is not surjective at  $(x, p - x)$ . Therefore, by the Sard theorem, set of such  $p$  has measure zero.  $\square$

**Proposition 4.1.2.** *Let  $M$  be a manifold. The set of Morse functions is dense in  $C^\infty(M)$ .*

*Proof.* Let  $f$  be a smooth function on  $M$ . Embed  $M$  in  $\mathbb{R}^{d-1}$  such that  $x \mapsto (x_2, \dots, x_d)$ . Then,  $x \mapsto (f(x), x_2, \dots, x_d)$  gives an embedding into  $\mathbb{R}^d$ . Define a sequence  $\{\varepsilon_n\}_n \subset \mathbb{R}^n$  such that  $\varepsilon_n \rightarrow 0$  and the sequence of functions

$$f_n(x) := \frac{\|x + n e_1 + \varepsilon_n\|^2 - n^2}{2n}$$

is Morse, where  $\{e_i\}$  denotes the standard basis of  $\mathbb{R}^d$ . This can be done by the previous proposition. Then,

$$\begin{aligned} f_n(x) &= \frac{(f(x) + n + \varepsilon_n \cdot e_1)^2 + \dots + (x_n + \varepsilon_n \cdot e_d)^2 - n^2}{2n} \\ &= f(x) + \frac{\|x + \varepsilon_n\|}{2n} + \varepsilon_n \cdot e_1 \end{aligned}$$

proves that  $\|f_n - f\|_{C^k(K)} \rightarrow 0$  on every compact  $K \subset M$ .  $\square$

**Theorem 4.1.3** (Morse lemma). *Let  $p$  be a nondegenerate critical point of a Morse function  $f$  on a manifold  $M$ . Then, there exists a local chart  $(U, \varphi)$  of  $p$  such that*

$$f \circ \varphi^{-1}(x_1, \dots, x_m) = f(p) - \sum_{i=1}^k x_i^2 + \sum_{i=k+1}^n x_i^2$$

for some  $k$ . This chart is called Morse chart.

*Proof.*  $\square$

**Corollary 4.1.4.** *The critical points of a Morse function are isolated. In particular, on a compact manifold are finitely many critical points of a Morse function.*

## 4.2 Pseudo-gradients

**Definition 4.2.1.** Let  $f$  be a Morse function on a manifold  $M$ . A *pseudo-gradient* adapted to  $f$  is a vector field  $X$  such that

- (a)  $df(X) < 0$  at all noncritical points,
- (b) there is a Morse chart at critical points in which  $X = \text{grad } f$ , where the metric is induced from the chart.

**Proposition 4.2.1.** *A pseudo-gradient always exists for any Morse functions.*

*Proof.* Cover the manifold with charts such that every critical point is contained in a unique chart, which is Morse. For each chart  $(U, \varphi)$ , we can define a vector field on  $U$  by

$$X := -d\varphi^{-1}(\text{grad}(f \circ \varphi^{-1})),$$

using the standard metric on  $\varphi(U)$ . Then, we have

$$df(X) = -\langle \text{grad}(f \circ \varphi^{-1}), \text{grad}(f \circ \varphi^{-1}) \rangle \leq 0,$$

where the equality holds only at critical points. With a partition of unity, the vector fields are combined and easily checked to be pseudogradient.  $\square$

**Definition 4.2.2.** Let  $p$  be a critical point of a Morse function  $f$  on a manifold  $M$ . Denote  $\varphi^s : M \rightarrow M$  by the flow of a pseudo-gradient. A *stable manifold* is defined as

$$W^s(p) := \{ x \in M : \lim_{s \rightarrow \infty} \varphi^s(x) = p \},$$

and an *unstable manifold* is defined as

$$W^u(p) := \{ x \in M : \lim_{s \rightarrow -\infty} \varphi^s(x) = p \}.$$

**Proposition 4.2.2.** *The stable manifolds and unstable manifolds are manifolds. Further, they are diffeomorphic open disks. Moreover, the index of  $p$  is equal to*

$$\dim W^u(p) = \operatorname{codim} W^s(p)$$

.
