**Part I**

**Measure theory**

# Chapter 1

## Measures and $\sigma$ -algebras

### 1.1 Definition of measures

### 1.2 The Carathéodory extension theorem

**1.1 (Outer measures).** Let  $X$  be a set. An *outer measure* on  $X$  is a function  $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$  with  $\mu^*(\emptyset) = 0$  such that

(i) if  $E \subset E'$ , then  $\mu^*(E) \leq \mu^*(E')$ , (monotonicity)

(ii)  $\mu^*(\bigcup_{i=1}^{\infty} E_i) \leq \sum_{i=1}^{\infty} \mu^*(E_i)$ . (countable subadditivity)

(a) A function  $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$  with  $\mu^*(\emptyset) = 0$  is an outer measure if and only if  $E \subset \bigcup_{i=1}^{\infty} E_i$  implies  $\mu^*(E) \leq \sum_{i=1}^{\infty} \mu^*(E_i)$ .

(b) Let  $\mathcal{A} \subset \mathcal{P}(X)$  such that  $\emptyset \in \mathcal{A}$ . If a function  $\rho : \mathcal{A} \rightarrow [0, \infty]$  satisfies  $\rho(\emptyset) = 0$ , then we can associate an outer measure  $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$  by defining as

$$\mu^*(E) := \inf \left\{ \sum_{i=1}^{\infty} \rho(A_i) : E \subset \bigcup_{i=1}^{\infty} A_i, A_i \in \mathcal{A} \right\},$$

where we use the convention  $\inf \emptyset = \infty$ .

**1.2 (Carathéodory measurability).** Let  $\mu^*$  be an outer measure on a set  $X$ . A subset  $A \subset X$  is called *Carathéodory measurable* relative to  $\mu^*$  if

$$\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \cap A^c)$$

for every subset  $E \subset X$ . Let  $\mathcal{M}$  be the collection of all Carathéodory measurable subsets relative to  $\mu^*$ .

- (a)  $\mathcal{M}$  is an algebra and  $\mu^*$  is finitely additive on  $\mathcal{M}$ .
- (b)  $\mathcal{M}$  is a  $\sigma$ -algebra and  $\mu^*$  is countably additive on  $\mathcal{M}$ , that is, the restriction  $\mu := \mu^*|_{\mathcal{M}} : \mathcal{M} \rightarrow [0, \infty]$  is a measure.
- (c) The measure  $\mu$  is complete.

**1.3** (The Carathéodory extension theorem). Let  $\mathcal{A} \subset \mathcal{P}(X)$  be a semi-ring of sets on a set  $X$  and  $\rho : \mathcal{A} \rightarrow [0, \infty]$  a function with  $\rho(\emptyset) = 0$ . If the function  $\rho$  satisfies

- (i)  $\rho(A) = \sum_{i=1}^n \rho(A_i)$  for  $A \in \mathcal{A}$  a disjoint union of  $\{A_i\}_{i=1}^n \subset \mathcal{A}$ , (finite additivity)
- (ii)  $\rho(A) \leq \sum_{i=1}^{\infty} \rho(A_i)$  for  $A \in \mathcal{A}$  a disjoint union of  $\{A_i\}_{i=1}^{\infty} \subset \mathcal{A}$ ,  
((disjoint) countable subadditivity)

then it is called a *premeasure*.

Let  $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$  be the associated outer measure of  $\rho$ , and  $\mu : \mathcal{M} \rightarrow [0, \infty]$  the measure defined from  $\mu^*$  on Carathéodory measurable subsets. We call  $\mu$  the *Carathéodory measure* constructed from  $\rho$ .

- (a) If  $\rho$  is finitely additive, then  $\mathcal{A} \subset \mathcal{M}$ .
- (b) If  $\rho$  is countably subadditive, then  $\mu^*(A) = \rho(A)$  for every  $A \in \mathcal{A}$ .
- (c) If  $\rho$  is a premeasure, then  $\mu$  is an extension of  $\rho$  and called *Carathéodory extension* of  $\rho$ .
- (d) In particular, a premeasure is a priori countably additive in the sense that  $\rho(A) = \sum_{i=1}^{\infty} \rho(A_i)$  for  $A \in \mathcal{A}$  a disjoint countable union of  $\{A_i\}_{i=1}^{\infty} \subset \mathcal{A}$ .

# Chapter 4

## Lebesgue integration

### 4.1 Definition of Lebesgue integration

### 4.2 Convergence theorems

Stein: Egorov  $\rightarrow$  BCT  $\rightarrow$  Fatou  $\rightarrow$  MCT  $\rightarrow$  L1 is a measure : BCT + L1 is a measure  
 $\rightarrow$  DCT

Folland: MCT  $\rightarrow$  Fatou  $\rightarrow$  DCT  $\rightarrow$  BCT

### 4.3 Modes of convergence

Since  $\{f_n(x)\}_n$  diverges if and only if

$$\exists k > 0, \quad \forall n_0 > 0, \quad \exists n > n_0 : \quad |f_n(x) - f(x)| > \frac{1}{k},$$

we have

$$\begin{aligned} \{x : \{f_n(x)\}_n \text{ diverges} \} &= \bigcup_{k>0} \bigcap_{n_0>0} \bigcup_{n>n_0} \{x : |f_n - f| > \frac{1}{k}\} \\ &= \bigcup_{k>0} \limsup_n \{x : |f_n - f| > \frac{1}{k}\}. \end{aligned}$$

Since for every  $k$  we have

$$\begin{aligned} \limsup_n \{x : |f_n - f| > \frac{1}{k}\} &\subset \limsup_{n>k} \{x : |f_n - f| > \frac{1}{n}\} \\ &= \limsup_n \{x : |f_n - f| > \frac{1}{n}\}, \end{aligned}$$

we have

$$\{x : \{f_n(x)\}_n \text{ diverges}\} \subset \limsup_n \{x : |f_n - f| > \frac{1}{n}\}.$$

**Theorem 4.3.1.** *Let  $(X, \mu)$  be a measure space. Let  $f_n$  be a sequence of measurable functions. If  $f_n$  converges to  $f$  in measure, then  $f_n$  has a subsequence that converges to  $f$   $\mu$ -a.e.*

*Proof.* We can extract a subsequence  $f_{n_k}$  such that

$$\mu(\{x : |f_{n_k} - f| > \frac{1}{k}\}) < \frac{1}{2^k}.$$

Since

$$\sum_{k=1}^{\infty} \mu(\{x : |f_{n_k} - f| > \frac{1}{k}\}) < \infty,$$

by the Borel-Canteli lemma, we get

$$\mu(\limsup_k \{x : |f_{n_k} - f| > \frac{1}{k}\}) = 0.$$

Therefore,  $f_{n_k}$  converges  $\mu$ -a.e. □

# Chapter 10

## Weak derivatives

The space of weakly differentiable functions with respect to all variables  $= W_{\text{loc}}^{1,1}$ .

**10.1** (Product rule for weakly differentiable functions). We want to show that if  $u$ ,  $v$ , and  $uv$  are weakly differentiable with respect to  $x_i$ , then  $\partial_{x_i}(uv) = \partial_{x_i}u v + u \partial_{x_i}v$ .

(a) If  $u$  is weakly differentiable with respect to  $x_i$  and  $v \in C^1$ , then  $\partial_{x_i}(uv) = \partial_{x_i}u v + u \partial_{x_i}v$ .

**10.2** (Interchange of differentiation and integration). Let  $f : \Omega \rightarrow \mathbb{R}$  such that  $f(x, y)$  and  $\partial_{x_i}f(x, y)$  are both locally integrable in  $x$  and integrable  $y$ . Then,

$$\partial_{x_i} \int f(x, y) dy = \int \partial_{x_i} f(x, y) dy$$

where  $\partial_{x_i}$  denotes the weak partial derivative.

# Chapter 11

## Absolutely continuity

- (a)  $f$  is  $\text{Lip}_{\text{loc}}$  iff  $f'$  is  $L_{\text{loc}}^{\infty}$
- (b)  $f$  is  $\text{AC}_{\text{loc}}$  iff  $f'$  is  $L_{\text{loc}}^1$
- (a)  $f$  is  $\text{Lip}$  iff  $f'$  is  $L^{\infty}$
- (b)  $f$  is  $\text{AC}$  iff  $f'$  is  $L^1$
- (c)  $f$  is  $\text{BV}$  iff  $f'$  is a finite regular Borel measure
