## 1 Day 1: April 6

## 1. Modules

References: Atsushi Shiho, Yukiyoshi Kawada

#### 1.1. R-modules

**Definition 1.1.** Let *R* be a ring with 1. A (left) *R*-module is an abelian group *M* with a map  $R \times M \rightarrow M$ :  $(a, x) \mapsto ax$  satisfying a(x + y) = ax + ay, (a + b)x = ax + bx, (ab)x = a(bx), 1x = x.

**Example 1.2.** (a) Every abelian group is a  $\mathbb{Z}$ -module. The R-module structures on an abelian group M has 1-1 correspondence with the ring homomorphisms  $R \to \operatorname{End}_{\mathbb{Z}}(M)$ .

(b) 
$$M = C^{\infty}(\mathbb{R}), R = \mathbb{R}[T]$$
 a polynomial ring,  $R \times M \to M : (P(T), f(x)) \mapsto P(\frac{d}{dx})f(x)$ .

**Definition 1.3.** A (left) *R*-submodule of *M* is a subgroup  $N \subset M$  such that  $ax \in N$  for  $a \in R$ ,  $x \in N$ . A (left) *R*-homomorphism is a group homomorphism  $M \to N$  which preserves the action of *R*.

**Example 1.4.** (a)  $M = C^{\infty}(\mathbb{R}), R = \mathbb{R}[T]$ , then  $\varphi : M \to M : f(x) \mapsto f(x+1)$  is an R-homomorphism.

**Definition 1.5.** Let  $f: M \to N$  be an R-homomorphism. The kernel of f is  $\ker f := \{x \in M : f(x) = 0\} \xrightarrow{i} M$ , and the cokernel of f is  $N \xrightarrow{p} \operatorname{coker} f := N / \operatorname{im} f$ , where the image is  $\operatorname{im} f := \{f(x) \in N : x \in M\} \xrightarrow{j} N$ .

$$\ker f \xrightarrow{i} M \xrightarrow{f} N \xrightarrow{p} \operatorname{coker} f$$

$$\operatorname{im} f$$

On each of them, there is a unique R-module structure such that the each map i, j, p becomes an R-homomorphism respectively.

**Theorem 1.6** (Universal property). For the above setting, note that fi = 0 and pf = 0. If an R-homomorphism  $g: M' \to M$  satisfies fg = 0, then there is a unique R-homomorphism  $h: M' \to \ker f$  such that g = ih. If an R-homomorphism  $g: N \to N'$  satisfies gf = 0, then there is a unique R-homomorphism  $h: \operatorname{coker} f \to N'$  such that g = hp.

## 1.1 Commutative diagrams and exact sequences

**Definition 1.7** (Diagram). Among some *R*-modules suppose we have *R*-homomorphisms as the following diagram:

$$\begin{array}{ccc}
M_1 & \xrightarrow{f_1} & M_2 \\
f_3 \downarrow & & \downarrow g_1 \\
M_3 & \xrightarrow{g_2} & M_4 & .
\end{array}$$

Then, if the compositions sharing each source and target coincide, then we say the diagram is commutative. For example, we say the triangle formed by  $M_2$ ,  $M_3$ ,  $M_4$  is commutative iff  $g_1 = g_2 f_2$ .

Definition 1.8 (Sequence). A sequence is a diagram of R-modules placed linearly as

$$\cdots \longrightarrow M_n \xrightarrow{f_n} M_{n+1} \xrightarrow{f_{n+1}} M_{n+2} \longrightarrow \cdots.$$

2

If  $im f_n = ker f_{n+1}$  for all n, then we say the sequence is exact.

**Example 1.9.** (a)  $f: M \to N$  is injective iff  $0 \to M \xrightarrow{f} N$  is exact.  $f: M \to N$  is surjective iff  $M \xrightarrow{f} N \to 0$  is exact.

(b) 
$$0 \longrightarrow \ker f \xrightarrow{i} M \xrightarrow{f} N \xrightarrow{p} \operatorname{coker} f \longrightarrow 0$$

is exact.

(c) 
$$0 \to \mathbb{Z} \xrightarrow{n} \mathbb{Z} \to \mathbb{Z}/n\mathbb{Z} \to 0$$

is exact.

(d)  $0 \to \mathbb{R} \cos x \oplus \mathbb{R} \sin x \xrightarrow{n} C^{\infty}(\mathbb{R}) \xrightarrow{\frac{d^2}{dx^2} + 1} C^{\infty}(\mathbb{R}) \to 0$ 

is exact.

**Proposition 1.10** (Five lemma). Suppose each row is exact in the folloing commutative diagram:

Then,

(a)

(b)

(c)

*Proof.* (a) We will show  $x \in \ker h_3$  is in the image of  $f_2f_1$ :  $h_3(x) = 0 \implies f_3(x) = 0 \implies x = f_2(y) \implies g_2h_2(y) = 0 \implies h_2(y) = g_1(z) \implies z = h_1(u) \implies f_1(u) = y$ . Then,  $x = f_2(y) = f_2f_1 = 0$ .

(b) Similar.

**Proposition 1.11** (Snake lemma). Suppose the second and the third rows are exact in the following commutative diagram:

	$\ker h_1$	$\ker h_2$	$\ker h_3$	
	$M_1$	$M_2$	$M_3$	0
0	$N_1$	$N_2$	$N_3$	
	$\operatorname{coker} h_1$	coker h <sub>2</sub>	coker 3	

(a) There is  $\delta : \ker h_3 \to \operatorname{coker} h_1$  such that

$$\ker h_1 \xrightarrow{k_1} \ker h_2 \xrightarrow{k_2} \ker h_3 \xrightarrow{\delta} \operatorname{coker} h_1 \xrightarrow{l_1} \operatorname{coker} h_2 \xrightarrow{l_2} \operatorname{coker} 3$$

is exact. Here  $k_1, k_2, l_1, l_2$  are induced from  $f_1, f_2, g_1, g_2$ , respectively. The element  $\delta(x)$  is determined by u such that  $x = f_2(y)$ ,  $z = h_2(y)$ ,  $z = g_1(u)$ , and we can check that u does not depend on the choice of y.

(b)

*Proof.* (a) We have to show the well-definedness of  $\delta$ , ker  $\subset$  im, and im  $\subset$  ker. Skip.

In the general abelian cateogies, the five lemma and the snake lemma hold but the proofs become more complicated.

## 1.2 Direct sum, direct product, inductive limit, direct limit

**Definition 1.12.** Let  $M_{\lambda}$  be a family of *R*-modules. The direct product is

$$\prod_{\lambda} M_{\lambda} := \{(x_{\lambda}) : x_{\lambda} \in M_{\lambda}\} \twoheadrightarrow M_{\lambda},$$

and the direct sum is the submodule of the direct product such that

$$\bigoplus_{\lambda} M_{\lambda} := \{(x_{\lambda}) : x_{\lambda} = 0 \text{ but finitely many}\} \hookrightarrow M_{\lambda}$$

**Proposition 1.13** (Universal property). (a) For  $f_{\mu}: M_{\mu} \to N$  there is unique  $f: \bigoplus_{\lambda} M_{\lambda} \to N$  such that  $fi_{\mu} = f_{\mu}$ .

(b) For  $g_{\mu}: N \to M_{\mu}$  there is unique  $g: N \to \prod_{\lambda} M_{\lambda}$  such that  $p_{\mu}g = g_{\mu}$ .

*Remark* 1.14. (a) The direct sum and direct product is unique up to isomorphism by the universal property.

- (b) For *R*-homomorphisms  $f_{\lambda}: M_{\lambda} \to N_{\lambda}$  we can induce  $\prod_{\lambda} f_{\lambda}: \prod_{\lambda} M_{\lambda} \to \prod_{\lambda} N_{\lambda}$  and  $\bigoplus_{\lambda} f_{\lambda}: \bigoplus_{\lambda} M_{\lambda} \to \bigoplus_{\lambda} N_{\lambda}$ .
- (c) In the category of modules, even for infinite indices, direct product and sum commute with the kernel, cokernel, and image. In an abelian category, we may not have infinite direct product/sum.
- (d) exactness also preserved under products and sums

## 2 Day 2: April 13

Let  $(\Lambda, \prec)$  be a totally ordered set. By a direct system, we refer the family of R-modules  $M_{\lambda}$  for each  $\lambda \in \Lambda$  and the family of R-homomorphisms  $\tau_{\mu\lambda}: M_{\lambda} \to M_{\mu}$  for  $\lambda \prec \mu$  such that  $\tau_{\lambda\lambda} = \mathrm{id}_{M_{\lambda}}$  and  $\tau_{\kappa\lambda} = \tau_{\kappa\mu}\tau_{\mu\lambda}$  for  $\lambda \prec \mu \prec \kappa$ .

#### Example.1.3.3.

- (a) Let  $\Lambda = \mathbb{N}$  and  $n \prec m \Leftrightarrow n \mid m, M_n = \mathbb{Z}$  and  $\tau_{mn}(z) : M_n \to M_m : z \mapsto (m/n)z$ .
- (b) Let M be a R-module,  $\{M_{\lambda}\}$  are finitely generated R-submodules of M, and  $\lambda \prec \mu \iff M_{\lambda} \subset M_{\mu}$ , with  $\tau_{\mu\lambda}$  inclusions.

#### Definition.

$$\lim_{\longrightarrow} M_{\lambda} = \lim_{\longrightarrow} (M_{\lambda}, \tau_{\mu\lambda}) := \operatorname{coker}(\bigoplus_{\substack{(\lambda, \mu) \in \Lambda \\ \lambda \prec \mu}} M_{\lambda} \xrightarrow{\Phi} \bigoplus_{\lambda \in \Lambda} M_{\lambda}),$$

where  $\Phi((x_{\lambda\mu})) = \sum_{\lambda \prec \mu} \iota_{\mu} \tau_{\mu\lambda}(x_{\lambda\mu}) - \iota_{\lambda}(x_{\lambda\mu})$ , and  $\iota_{\lambda} : M_{\lambda} \to \bigoplus_{\lambda} M_{\lambda}$  is a componentwise embedding. That is, we want to identify  $x \in M_{\lambda}$  and  $\tau_{\mu\lambda}(x) \in M_{\mu}$  with the map  $\Phi$ .

**Proposition.1.3.4.** Let  $\tau_{\mu}: M_{\mu} \xrightarrow{\iota_{\mu}} \bigoplus_{\lambda} M_{\lambda} \twoheadrightarrow \lim_{\longrightarrow} M_{\lambda}$ .

- (a)  $\tau_{\mu} = \tau_{\kappa} \tau_{\kappa \mu}$ .
- (b)  $M_{\mu} \xrightarrow{f_{\mu}} N$  for  $\mu \in \Lambda$  are R-homomorphisms, and they satisfy  $f_{\mu} = f_{\kappa} \tau_{\kappa \mu}$ . Then, there is a unique  $f: \lim_{\longrightarrow} M_{\lambda} \to N$  such that  $f_{\mu} = f \tau_{\mu}$

For each example in 1.3.3,  $\mathbb{Q}$  and M are the direct limits because it satisfies the universal property (1.3.4(b))

*Remark.* (1) The direct limit is unique by the universal property up to isomorphism.

(2) If  $f_{\lambda}: M_{\lambda} \to M'_{\lambda}$  are *R*-homomorphism such that

$$\begin{array}{ccc} M_{\lambda} & \stackrel{f_{\lambda}}{\longrightarrow} & M\lambda' \\ \downarrow & & \downarrow \\ M_{\mu} & \stackrel{f_{\mu}}{\longrightarrow} & M'_{\mu} \end{array}$$

commutes for all  $\lambda \prec \mu$ , then there is a unique f such that

$$\bigoplus_{\lambda \prec \mu} M_{\lambda} \longrightarrow \bigoplus_{\lambda} M_{\lambda} \longrightarrow \lim_{\longrightarrow} M_{\lambda} \longrightarrow 0$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$\bigoplus_{\lambda \prec \mu} M_{\lambda}' \longrightarrow \bigoplus_{\lambda} M_{\lambda}' \longrightarrow \lim_{\longrightarrow} M_{\lambda}' \longrightarrow 0$$

commutes, and f is denoted by  $\lim_{\longrightarrow} f_{\lambda}$ . It is by the universal property of cokernel.

**Definition.1.3.6.** A preordered set  $\Lambda$  is a directed set if  $\forall \lambda, \lambda' \in \Lambda$ , there is  $\mu \in \Lambda$  such that  $\lambda, \lambda' \prec \mu$ .

**Proposition.** *If*  $\Lambda$  *is a directed set, then there is a 1-1 correspondence* 

$$(\coprod_{\lambda} M_{\lambda})/\sim \to \lim_{\longrightarrow} M_{\lambda}: [x_{\lambda}] \mapsto \tau_{\lambda}(x_{\lambda}),$$

where  $x_{\lambda} \sim y_{\lambda'}$  iff there is  $\mu > \lambda$ ,  $\lambda'$  such that  $\tau_{\mu\lambda}(x_{\lambda}) = \tau_{\mu\lambda'}(y_{\lambda'})$ .

## Proposition. If

$$L_{\lambda} \xrightarrow{f_{\lambda}} M_{\lambda} \xrightarrow{g_{\lambda}} N_{\lambda} \longrightarrow 0$$

is exact, then

$$\operatorname{colim} L_{\lambda} \,\longrightarrow\, \operatorname{colim} M_{\lambda} \,\longrightarrow\, \operatorname{colim} N_{\lambda} \,\longrightarrow\, 0$$

is exact.

*Proof.* The only non-trivial part is the exactness at colim  $M_{\lambda}$ . We can prove it by diagram chasing.  $\Box$ 

## Example. Examples of inverse limit

- (a) projection  $\mathbb{Z}/p^m\mathbb{Z} \to \mathbb{Z}/p^n\mathbb{Z}$  for m > n.
- (b) restriction  $C^{\infty}((-r,r)) \to C^{\infty}((-r',r'))$  for r' > r.

## 3 Day 3: April 20

Example. Limit preserves injectivity, but not surjectivity: although the diagram

commutes, but the induced map  $\mathbb{Z} \to \mathbb{Z}_p := \lim_n \mathbb{Z}/p^n \mathbb{Z}$  is not surjective because we have an element  $x \in \mathbb{Z}_p$  such that for  $\pi_n : \mathbb{Z}_p \to \mathbb{Z}/p^n \mathbb{Z}$  we have  $\pi_n(x) \equiv 1 \pmod{p^n}$  for all n.

Lemma (Mittag-Leffler condition). Let

$$0 \to M_n \to N_n \to L_n \to 0$$

be a sequence of exact sequences. Suppose  $(M_n)$  satisfies that for each n we have a eventually constant monotonically decreasing sequence

$$M_n \supset \pi_{n,n+1}(M_{n+1}) \supset \pi_{n,n+2}(M_{n+2}) \supset \cdots$$

of submodules of  $M_n$ . Then,

$$0 \to \lim M_n \to \lim N_n \to \lim L_n \to 0.$$

Note that when we consider the seuqence of kernels  $p^n\mathbb{Z}$  of the maps  $\mathbb{Z} \to \mathbb{Z}/p^n\mathbb{Z}$  in the above example, we can check the sequence does not satisfy the Mittag-Leffler condition.

## 1.4. Properties of Hom

From now on, we always let R be a commutative ring and M,N be a R-modules. Define

$$\operatorname{Hom}_R(M,N) := \{ f : M \to N, R\text{-homomorphism} \}.$$

It is an R-module, which is not the case if R is not commutative. If  $\varphi: N_1 \to N_2$  is an R-homomorphism, then

$$\operatorname{Hom}_R(M, N_1) \to \operatorname{Hom}_R(M, N_2) : f \mapsto \varphi \circ f$$

is an *R*-homomorphism. If  $\psi: M_1 \to M_2$  is an *R*-homomorphism, then

$$\operatorname{Hom}_R(M_2,N) \to \operatorname{Hom}_R(M_1,N) : f \mapsto f \circ \psi$$

is an R-homomorphism.

## Proposition.1.4.1.

(a) If

$$0 \rightarrow N_1 \rightarrow N_2 \rightarrow N_3$$

is exact, then

$$0 \to \operatorname{Hom}_R(M, N_1) \to \operatorname{Hom}_R(M, N_2) \to \operatorname{Hom}_R(M, N_3)$$

is exact.

(b) *If* 

$$M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$$

is exact, then

$$0 \to \operatorname{Hom}_{\mathbb{R}}(M_3, N) \to \operatorname{Hom}_{\mathbb{R}}(M_2, N) \to \operatorname{Hom}_{\mathbb{R}}(M_1, N)$$

is exact.

*Proof.* (a) If  $f_2 \in \operatorname{Hom}_R(M, N_2)$  satisfies  $\varphi_2 \circ f_2 = 0$ , then by the universal property there exists unique  $f_1 : M \to N_1$  such that the diagram

$$0 \longrightarrow N_1 \stackrel{\exists! f_1}{\longrightarrow} N_2 \stackrel{\varphi_2}{\longrightarrow} N_3$$

commutes.

Example. For

$$0 \to \mathbb{Z} \xrightarrow{\cdot n} \mathbb{Z} \to \mathbb{Z}/n\mathbb{Z} \to 0,$$

The maps

$$0 \cong \operatorname{Hom}(\mathbb{Z}/n\mathbb{Z}, \mathbb{Z}) \to \operatorname{Hom}(\mathbb{Z}/n\mathbb{Z}, \mathbb{Z}/n\mathbb{Z}) \cong \mathbb{Z}/n\mathbb{Z}$$

and

$$\mathbb{Z} \cong \operatorname{Hom}(\mathbb{Z}, \mathbb{Z}) \xrightarrow{\circ (\cdot n)} \operatorname{Hom}(\mathbb{Z}, \mathbb{Z}) \cong \mathbb{Z}$$

are not surjective.

## 1.5. Projective modules

**Definition.1.5.1.** An *R*-module is said to be *projective* if for every surjective  $\varphi: N_1 \twoheadrightarrow N_2$  and for every  $f: M \to N_2$ , there is a map  $\widetilde{f}: M \to N_1$  such that

$$\begin{array}{ccc}
& M \\
& \downarrow^{f} & \downarrow^{f} \\
N_{1} & \longrightarrow & N_{2}
\end{array}$$

commutes, equivalently,

$$\operatorname{Hom}_R(M, N_1) \to \operatorname{Hom}_R(M, N_2) \to 0$$

is exact for every exact  $N_1 \rightarrow N_2 \rightarrow 0$ .

**Proposition.1.5.2.** *If* M *is a projective module, then*  $Hom_R(M, -)$  *is an exact functor.* 

**Proposition.1.5.3.** A direct sum of R-modules is projective iff its summands are all projective. In particular, a free R-module is projective.

**Corollary.**1.5.4. As a corollary, a module M is projective if and only if there is another module N such that  $M \oplus N$  is free.

*Proof.* ( $\Rightarrow$ ) Take generators of  $\{e_{\lambda}\}_{\lambda}$  of M. Then, for

$$f:\bigoplus_{\lambda}R \twoheadrightarrow M:(a_{\lambda})\mapsto \sum_{\lambda}a_{\lambda}e_{\lambda},$$

we have an exact sequence

$$0 \to \ker f \to \bigoplus_{j} R \to M \to 0,$$

which is right split by applying the definition of projective modules to extend the codomain of  $id_M : M \to M$ .

**Corollary.**1.5.5. Let R be a PID. Then, since a submodule of a free module is free, so a module is projective if and only if it is free.

## 1.6. Injective modules

**Definition.1.6.1.** An *R*-module is said to be injective if for every injective  $\varphi: N_1 \hookrightarrow N_2$  and for every  $g: N_1 \to M$ , there is a map  $\widetilde{g}: N_2 \to M$  such that

$$\begin{matrix} N_1 & \stackrel{\varphi}{\longleftarrow} & N_2 \\ \downarrow^g & \stackrel{f}{\swarrow} & g \end{matrix}$$

commutes, equivalently,

$$\operatorname{Hom}_R(N_2, M) \to \operatorname{Hom}_R(N_1, M) \to 0$$

is exact for every exact  $0 \rightarrow N_1 \rightarrow N_2$ .

**Proposition.1.6.3.** An R-module M is injective iff the restriction  $\operatorname{Hom}(R,M) \to \operatorname{Hom}(I,M)$  is surjective for every ideal I of R.

*Proof.* ( $\Rightarrow$ ) Clear. ( $\Leftarrow$ ) Suppose there is  $x \in N_2$  such that  $N_2 = N_1 + Rx$ . Define an ideal I of R such that there is an exact sequence

$$0 \rightarrow I \rightarrow N_1 \oplus R \rightarrow N_2 \rightarrow 0$$
,

in which the first map sends b to (-bx, b) and the second map sends (y, a) to y + ax. Define  $h : I \to M$  by h(b) := g(bx) and extend it to  $h : R \to M$ . Define  $g : N_2 \to M$  by g(y + ax) := g(y) + h(a). We can check it is well-defined from the exactness of the above defining sequence of I. (To be continued..)

**Corollary.1.6.4.** If R is a PID, then an R-module M is injective iff for all  $0 \neq a \in R$  the map  $M \xrightarrow{\cdot a} M$  is surjective.

*Proof.* Let *I* be an ideal. If I = 0, then clear. If not, we have I = aR for some  $0 \neq a \in R$ . Then, the restriction  $\text{Hom}(R, M) \to \text{Hom}(I, R)$  is surjective if and only if

$$M \xrightarrow{\sim} \operatorname{Hom}(R, M) \to \operatorname{Hom}(aR, M) \xrightarrow{\sim} aM$$
  
 $m \mapsto (1 \mapsto m) \mapsto (a \mapsto am) \mapsto am$ 

is surjective.

**Example.** If  $R = \mathbb{Z}$ , then  $\mathbb{Q}$  and  $\mathbb{Q}/\mathbb{Z}$  are injective, and  $\mathbb{Z}$  and  $\mathbb{Z}/n\mathbb{Z}$  are not injective.

## 4 Day 4: April 27

*Proof of 1.6.3.* Let S be the set of all pairs (N,h) such that  $N_1\subset N\subset N_2$  and

$$\begin{array}{ccc}
N_1 & \longrightarrow & N \\
\downarrow & & & \\
M & & & \\
\end{array}$$

commutes, and define a partial order  $\prec$  such that  $(N,h) \prec (N',h')$  if ando only if

$$\begin{array}{ccc}
N & \longrightarrow & N' \\
\downarrow & & \\
M
\end{array}$$

commutes. Since the union of a chain belongs to S, S has a maximal element  $(N_0, h_0)$  by Zorn's lemma. If  $N_0 \subsetneq N_2$ , then by taking  $x \in N_2 \setminus N_0$ , we can show  $N_0$  is not maximal, so  $N_0 = N_2$ .

**Proposition.1.6.5.** Let  $M_{\lambda}$  be R-modules, and M be their product. Then, M is injective if and only if every  $M_{\lambda}$  is injective.

*Proof.* Apply the definition on the following diagram to show the first row is surjective:

$$\begin{array}{ccc} \operatorname{Hom}_R(N_2, \prod_{\lambda} M_{\lambda}) & \longrightarrow & \operatorname{Hom}_R(N_1, \prod_{\lambda} M_{\lambda}) \\ & & \downarrow = & & \downarrow = \\ \prod_{\lambda} \operatorname{Hom}_R(N_2, M_{\lambda}) & \longrightarrow & \prod_{\lambda} \operatorname{Hom}_R(N_1, M_{\lambda}). \end{array}$$

**Proposition.1.6.6.** *If* M *is injective* Z-module, then  $Hom_{\mathbb{Z}}(R, M)$  *is an injective* R-module.

**Lemma.1.6.7.** Let N be an R-module and M be a  $\mathbb{Z}$ -module. Then,  $\operatorname{Hom}_{\mathbb{Z}}(R,M)$  is an R-module, and there is a bijection

$$\operatorname{Hom}_R(N, \operatorname{Hom}_{\mathbb{Z}}(R, M)) \cong \operatorname{Hom}_{\mathbb{Z}}(N, M).$$

*Proof of Proposition 1.6.6.* Apply Lemma 1.6.7 to show the first row is surjective:

**Theorem.1.6.8.** Every R-module M is embedded in an injective R-module.

*Proof.* Suppose  $R = \mathbb{Z}$ . The surjectivity of

$$\bigoplus_{\lambda} \mathbb{Z} \twoheadrightarrow \mathrm{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})$$

implies

$$\operatorname{Hom}_{\mathbb{Z}}(\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z}),\mathbb{Q}/\mathbb{Z}) \hookrightarrow \operatorname{Hom}_{\mathbb{Z}}(\bigoplus_{\lambda} \mathbb{Z},\mathbb{Q}/\mathbb{Z}) = \prod_{\lambda} \mathbb{Q}/\mathbb{Z}.$$

Then, it suffices to prove the canonical map

$$M \to \operatorname{Hom}_{\mathbb{Z}}(\operatorname{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z}), \mathbb{Q}/\mathbb{Z}))$$

is injective. For non-zero  $x \in M$ , by the injectivity of  $\mathbb{Q}/\mathbb{Z}$ , we can extend a  $\mathbb{Z}$ -homomorphism  $f: \mathbb{Z}x \to \mathbb{Q}/\mathbb{Z}$  satisfying  $f(x) \neq 0$  to a  $\mathbb{Z}$ -homomorphism  $\widetilde{f}: M \to \mathbb{Q}/\mathbb{Z}$  satisfying  $\widetilde{f}(x) = f(x) \neq 0$ . Threrfore, we are done.

Now let R be arbitrary commutative ring. Consider an R-homomorphism

$$\Phi: M \hookrightarrow \operatorname{Hom}_{\mathbb{Z}}(R, M): x \mapsto (a \mapsto ax),$$

which is easily checked to be injective by putting a=1. Let M' be an injective  $\mathbb{Z}$ -module with an injective  $\mathbb{Z}$ -homomorphism  $M \to M'$ , and it induces

$$M \hookrightarrow \operatorname{Hom}_{\mathbb{Z}}(R, M) \hookrightarrow \operatorname{Hom}_{\mathbb{Z}}(R, M').$$

#### 1.7. Tensor products

**Definition.1.7.1.** Let R be a commutative ring, and  $M_1, M_2, N$  be R-modules. Let  $\Phi: M_1 \times M_2 \to N$  be an R-bilinear map. If R is non-commutative, then  $M_1$  and  $M_2$  are set to be right and left R-modules resepctively, and  $\Phi$  is just a  $\mathbb{Z}$ -bilinear map but required to satisfy an additional condition  $\Phi(-a, -) = \Phi(-, a-)$ . Such  $\Phi$  is called a balanced product.

There is an *R*-module such that the following universal property holds: for every balanced product  $\Phi: M_1 \to M_2 \to N$ , there is a unique *R*-homomorphism

$$M_1 \times M_2 \xrightarrow{\otimes} M$$

Ν

Then, M is called the tensor product of  $M_1$  and  $M_2$ .

*Proof.* Let  $\widetilde{M}$  be a free R-module generated by  $M_1 \times M_2$ . Let  $\widetilde{M}_0$  be a R-subodule of  $\widetilde{M}$  generated by

$$(p+p',q)-(p,q)-(p',q), (p,q+q')-(p,q)-(p,q'),$$
  
 $(ap,q)-a(p,q), (p,aq)-a(p,q).$ 

Let  $M := \widetilde{M}/\widetilde{M}_0$ . Then, it satisfies the universal property(Exercise!).

Remark 4.1.1.7.2.

- (a) The tensor product is unique.
- (b)  $M_1 \otimes M_2$  is an *R*-module.
- (c) For  $f_1: M_1 \to M_1'$  and  $f_2: M_2 \to M_2'$ , we have an R-homomorphism  $f_1 \otimes f_2: M_1 \otimes M_2 \to M_1' \otimes M_2'$  defined by

$$\begin{array}{cccc} M_1 \times M_2 & \stackrel{\otimes}{-\!\!\!-\!\!\!-\!\!\!-\!\!\!-\!\!\!-} & M_1 \otimes_R M_2 \\ \downarrow & & \downarrow^{\exists! f_1 \otimes f_2} \\ M_1' \times M_2' & \stackrel{\otimes}{-\!\!\!\!-\!\!\!-\!\!\!-} & M_1' \otimes_R M_2'. \end{array}$$

## **Proposition 4.2.1.7.3.**

- (a)  $R \otimes_R M \cong M$ .
- (b)  $M \otimes_R R \cong M$ .
- (c)  $(\bigoplus_{\lambda} M_{\lambda}) \otimes_{R} N \cong \bigoplus_{\lambda} (M_{\lambda} \otimes_{R} N)$ .
- (d)  $N \otimes_R (\bigoplus_{\lambda} M_{\lambda}) \cong \bigoplus_{\lambda} (N \otimes_R M_{\lambda}).$

*Proof.* Use the universal properties for the right-hand sides.

**Proposition 4.3.1.7.4.** *Let R be commutative.* 

(a) 
$$(M_1 \otimes_R M_2) \otimes_R M_3 \cong M_1 \otimes_R (M_2 \otimes_R M_3)$$
.

(b) 
$$M_1 \otimes_R M_2 \cong M_2 \otimes_R M_1$$
.

Proof. (a) Use the universal property.

(b) Omitted.

#### **Proposition 4.4.1.7.5.** *If*

$$M_1 \xrightarrow{f} M_2 \to M_3 \to 0$$

is exact, then

$$N \otimes_R M_1 \to N \otimes_R M_2 \to N \otimes_R M_3 \to 0$$

is exact.

*Proof.* We can construct a unique  $\Psi$  by the universal property of  $N \otimes M_2$  so that the following diagram commutes.

Therefore, we can check  $\operatorname{coker}(\operatorname{id}_N \otimes f)$  satisfies the universal property.

Example. We have

$$M/IM \cong (R \otimes M)/(I \otimes M) \cong (R/I) \otimes M$$
.

If M = R/I, then

$$I/I^2 \to R/I \to (R/I)^{\otimes 2} \to 0$$

is exact, and the first map is not injective.

Direct limit.

$$(\operatorname{colim}_{\lambda} N_{\lambda}) \otimes_{R} M \cong \operatorname{colim}_{\lambda} (N_{\lambda} \otimes_{R} M).$$

Proof.

$$(\bigoplus_{\lambda<\mu} N_{\lambda}) \otimes_{R} M \longrightarrow (\bigoplus_{\lambda} N_{\lambda}) \otimes_{R} M \longrightarrow \operatorname{coker} \longrightarrow 0$$

$$\otimes \uparrow \qquad \qquad \otimes \uparrow \qquad \qquad \otimes \uparrow \qquad \qquad \otimes \uparrow \qquad \qquad \oplus$$

$$\bigoplus_{\lambda<\mu} (N_{\lambda} \otimes_{R} M) \longrightarrow \bigoplus_{\lambda} (N_{\lambda} \otimes_{R} M) \longrightarrow \operatorname{colim}_{\lambda} (N_{\lambda} \otimes_{R} M)$$

## 5 Day 5: May 11

#### 1.8. Flat modules

**Definition** (1.8.1). Let R be a commutative ring and M be an R-module. We say M is flat if  $\mathrm{id} \otimes f: M \otimes N_1 \to M \otimes N_2$  is injective for every injective  $f: N_1 \hookrightarrow N_2$ . If R is noncommutative, consider  $-\otimes M$  and  $M \otimes -$  for left and right modules M respectively.

#### Example.

- (a) A free R-module is flat since tensor product and direct sum satisfy the distribution law.
- (b) A direct limit of flat modules is flat. For example,  $\mathbb{Q} = \text{colim } \frac{1}{n}\mathbb{Z}$  is flat.

**Proposition** (1.8.2). *If* M *is flat, then*  $M \otimes_R - is$  *an exact functor.* 

**Proposition** (1.8.3). Let M be a left R-module. Then, we can give  $\operatorname{Hom}_{\mathbb{Z}}(M,\mathbb{Q}/\mathbb{Z})$  a right R-module structure by (fa)(x) = f(ax) for  $a \in R$  and  $x \in M$ . For an injective right R-homomorphism  $N_1 \hookrightarrow N_2$  between right R-modules,  $N_1 \otimes M \to N_2 \otimes M$  is injective if and only if

$$\operatorname{Hom}_R(N_2, \operatorname{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})) \xrightarrow{-\circ f} \operatorname{Hom}_R(N_1, \operatorname{Hom}(M, \mathbb{Q}/\mathbb{Z}))$$

is surjective.

Proof. We first observe that

$$\operatorname{Hom}_{\mathbb{Z}}(N \otimes M, \mathbb{Q}/\mathbb{Z}) \cong \operatorname{Hom}_{R}(N, \operatorname{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})).$$

Also we have the following from the fact that  $\mathbb{Q}/\mathbb{Z}$  is injective: for  $\mathbb{Z}$ -module homomorphism  $f:L_1\to L_2$ , f is injective if and only if  $\operatorname{Hom}_{\mathbb{Z}}(L_1,\mathbb{Q}/\mathbb{Z})\to \operatorname{Hom}_{\mathbb{Z}}(L_2,\mathbb{Q}/\mathbb{Z})$  is surjective.

*Remark.* If  $N \cap R \cap M \cap S$  and  $L \cap S$ , then  $\operatorname{Hom}_S(N \otimes_R M, L) \cong \operatorname{Hom}_R(N, \operatorname{Hom}_S(M, L))$ .

**Corollary** (1.8.4). For a left R-module M, M is flat if and only if  $\text{Hom}(M, \mathbb{Q}/\mathbb{Z})$  is injective.

**Corollary** (1.8.5). For a right R-module M, M is flat if and only if  $I \otimes_R M \to R \otimes_R M = M$  is injective for every right ideal  $I \subset R$ 

**Corollary** (1.8.6). Let R be a PID. Then, M is flat if and only if  $M \stackrel{\cdot a}{\to} M$  is injective for every  $a \in R$ .

Proof.

$$M = R \otimes M \cong I \otimes M \hookrightarrow R \otimes M = M$$
.

## 2. Complexes

#### 2.1. Definitions

**Definition** (2.1.1). A chain complex is a pair of a (bilateral) sequence of *R*-modules  $C_n$  and a (bilateral) sequence of *R*-homomorphisms  $\partial_n : C_n \to C_{n-1}$  such that  $\partial_{n-1} \circ \partial_n = 0$ .

A cochain complex is a pair of a (bilateral) sequence of *R*-modules  $C^n$  and a (bilateral) sequence of *R*-homomorphisms  $d^n: C^n \to C^{n+1}$  such that  $d^{n+1} \circ d^n = 0$ .

**Example** (2.1.2). The simplicial homology and the de Rham cohomology.

*Remark.* It is frequently assumed to be  $C_n = 0$  and  $C_n = 0$  for negative n.

**Definition** (2.1.3). Let  $C_{\bullet}$  be a chain complex. Then,  $Z_n(C_{\bullet}) := \ker \partial_n$ ,  $B_n(C_{\bullet}) := \operatorname{im} \partial_{n+1}$ , and  $H_n(C_{\bullet}) := Z_n(C_{\bullet})/B_n(C_{\bullet})$ . For cochain complexes, we can do the same thing.

A chain map between two chain complexes  $C_{\bullet}$  and  $C'_{\bullet}$  is a sequence  $f_{\bullet} = (f_n : C_n \to C'_n)$  such that  $\partial'_{n-1} \circ f_n = f_{n-1} \circ \partial_n$ . Then, we can check it induces  $H_n(f_{\bullet}) : H_n(C_{\bullet}) \to H_n(C'_{\bullet})$ .

A short sequence of chain complexes is said to be exact if the short sequence at each n is exact.

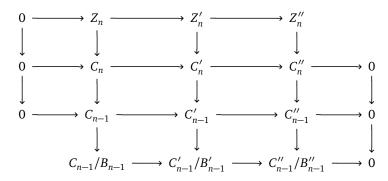

#### Theorem (2.1.4). If

$$0 \rightarrow C_{\bullet} \rightarrow C_{\bullet}' \rightarrow C_{\bullet}'' \rightarrow 0$$

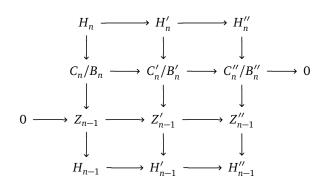

is exact, then there is a exact sequence

$$\cdots \to H_n(C_{\bullet}) \to H_n(C'_{\bullet}) \to H_n(C''_{\bullet}) \xrightarrow{\delta_n} H_{n-1}(C_{\bullet}) \to \cdots$$

Proof.

The snake lemma implies the exactness of the first and fourth rows.

The snake lemma implies the desired boundary map  $\delta_n$ .

## 2.2. Homotopy

**Definition** (2.2.1). Let  $f,g:C\to C'$  be chain maps. A sequence  $k=k_{\bullet}=(k_n:C_n\to C'_{n+1})$  of R-homomorphisms such that  $f_n-g_n=k_{n-1}\circ\partial_n+\partial'_{n+1}\circ k_n$  is called a homotopy between f and g.

**Proposition** (2.2.2). If  $f, g: C_{\bullet} \to C'_{\bullet}$  are homotopic, then  $H_n(f) = H_n(g)$ .

#### Example.

(a) Let K be an algebraic extension over  $\mathbb{Q}$ .

$$0 \longrightarrow K \longrightarrow K[x] \xrightarrow{\frac{d}{dx}} K[x] \longrightarrow 0$$

$$0 \longrightarrow K \longrightarrow K[x] \xrightarrow{\frac{d}{dx}} K[x] \longrightarrow 0$$

Define

$$k^{0}(\sum_{n\geq 0}a_{n}x^{n}):=a_{0}, \qquad k^{1}(\sum_{n\geq 0}a_{n}x^{n}):=\sum_{n\geq 0}(n+1)^{-1}a_{n+1}x^{n+1}.$$

Then, k is a homotopy between the zero and the identity, so the cohomology groups are all trivial. (cohomology groups of a exact cochain complex are trivial..?)

(b) Let S be a set and  $C^n := Map(S^{n+1}, M)$  for R-module M.

$$(d^n f)(x_0, \dots, x_{n+1}) = \sum_{i=0}^n (-1)^i f(x_0, \dots, \check{x}_i, \dots, x_n).$$

then, id and 0 are homotopic.

## 6 Day 6: May 18

#### 2.3. Double complexes

**Definition.** A double complex is a family of *R*-modules  $\{C_{p,q}\}$  indexed by  $(p,q) \in \mathbb{Z}^2$  together with *R*-homomorphisms  $\partial_{p,q}^I: C_{p,q} \to C_{p-1,q}$  and  $\partial_{p,q}^{II}: C_{p,q} \to C_{p,q-1}$  such that

- (i)  $(C_{\bullet,q}, \partial_{\bullet,q}^I)$  and  $(C_{p,\bullet}, \partial_{p,\bullet}^{II})$  are chain complexes,
- (ii)  $\partial^{II} \circ \partial^{I} + \partial^{I} \circ \partial^{II} = 0$ . (anticommuting squares convention, convenient in defining the total complex)

For a double complex, we can define total complex by

$$T_n := \bigoplus_{p+q=n} C_{p,q}, \qquad \partial_n : T_n \to T_{n-1} : (a_{p,q})_{p+q=n} \mapsto (\partial^I(a_{p,q})) + (\partial^{II}(a_{p,q})),$$

and it satisfies the axiom of chain complex;  $\partial^2 = 0$ . The total complex is denoted by  $\operatorname{Tot}^{\oplus}(C)$ . We can also define with  $\times$  instead of  $\oplus$  to get  $\operatorname{Tot}^{\Pi}(C)$ . If  $\operatorname{Tot}^{\oplus} = \operatorname{Tot}^{\Pi}$ , then we write it as  $\operatorname{Tot}$ .

**Example.** Let  $C_{\bullet}$  and  $C'_{\bullet}$  be chain complexes of right and left R-modules(resp.) for a commutative ring R. Then,  $D_{p,q} := C_p \otimes_R C_q$  and  $\partial^I_{p,q} = \partial_p \otimes \mathrm{id}$ ,  $\partial^{II}_{p,q} = (-1)^p \mathrm{id} \otimes \partial_q$  define a double complex, and its total complex is denoted by  $C \otimes_R C'$ .

**Example.** Let  $C_{\bullet}$  and  $C'^{\bullet}$  be chain and cochain complexes R-modules for a commutative ring R. Then,  $D_{p,q} := \operatorname{Hom}(C_p, C'^q)$  and  $d_{p,q}^I = -\circ \partial_{p+1}$ ,  $d_{p,q}^{II} = (-1)^{p+q+1}d^q \circ -$  define a double (cochain) complex, and its total complex is denoted by  $\operatorname{Hom}(C, C')$ .

Proposition (2.3.1).

- (a) Let  $f: C_{\bullet,\bullet} \to C'_{\bullet,\bullet}$ ;  $f_{p,q}: C_{p,q} \to C'_{p,q}$  commutes with  $\partial^I$  and  $\partial^{II}$ . Suppose there is  $N \in \mathbb{Z}$  such that p < N or q < N imply  $C_{p,q} = 0$  and  $C'_{p,q} = 0$ . Suppose also that  $H_n(C_{\bullet,q}, \partial^I) \cong H_n(C'_{\bullet,q}, \partial^I)$  for each  $n \in \mathbb{Z}$  and  $q \in \mathbb{Z}$ . Then,  $H_n(\operatorname{Tot}(C)) \cong H_n(\operatorname{Tot}(C'))$ .
- (b) Let  $f: C^{\bullet, \bullet} \to C'^{\bullet, \bullet}$ . Suppose there is  $N \in \mathbb{Z}$  such that p < N or q < N imply  $C^{p,q} = 0$  and  $C'^{p,q} = 0$ . If  $H^n(C^{\bullet,q}) \cong H^n(C'^{\bullet,q})$  for each  $n \in \mathbb{Z}$  and  $q \in \mathbb{Z}$ , then  $H^n(\operatorname{Tot}(C)) \cong H^n(\operatorname{Tot}(C'))$ .

Proof.

$$C_{p,q}^{\le r} = \begin{cases} 0 & q > r \\ C_{p,q} & q \le r \end{cases}$$

is a subcomplex of *C*. Then, we have an exact sequence

$$0 \to C^{\leq r-1} \to C^{\leq r} \to C^{(r)} \to 0$$

of double complexes. Taking Tot, we have

$$\longrightarrow H_n(\operatorname{Tot}(C^{\leq r-1})) \longrightarrow H_n(\operatorname{Tot}(C^{\leq r})) \longrightarrow H_n(\operatorname{Tot}(C^{(r)})) \longrightarrow$$

$$\downarrow \qquad \qquad \downarrow \sim$$

$$\longrightarrow H_n(\operatorname{Tot}(C^{\leq r-1})) \longrightarrow H_n(\operatorname{Tot}(C^{\leq r})) \longrightarrow H_n(\operatorname{Tot}(C^{(r)})) \longrightarrow$$

Note that  $H_n(\text{Tot}(C^{(r)})) = H_{n-r}(C_{\bullet,r})$  gives the isomorphism at the third column. Then, use the five lemma inductively.

16

#### 2.4. Ext and Tor

Let *C* be a chain complex of *R*-modules and *M* be an *R*-module. Then,  $C \otimes M$  is a chain complex and Hom(C, M) is a cochain complex. In this case, we have:

- (i) If *M* is flat, then  $H_n(C \otimes_R M) \cong H_n(C) \otimes_R M$ .
- (ii) If M is injective, then  $H_n(\operatorname{Hom}_R(C, M)) \cong \operatorname{Hom}_R(H^n(C), M)$ .

We want to measure the failure of this.

**Definition** (2.4.1). Let M be an R-module.

(a) A projective resolution is an exact sequence

$$0 \leftarrow M \stackrel{\varepsilon}{\leftarrow} P_0 \stackrel{\partial_1}{\leftarrow} P_1 \stackrel{\partial_2}{\leftarrow} P_2 \leftarrow \cdots,$$

where  $P_n$  is a projective for each n.

(b) A injective resolution is an exact sequence

$$0 \to M \to I^0 \to I^1 \to I^2 \to \cdots$$

where  $I^n$  is a injective for each n.

**Proposition** (2.4.2). Every R-module admits a projective resolution and an injective resolution.

*Proof.* Every module has a surjection(injection) from(to) a free(injective) module. Then, for the kernel(cokernel) we can do same thing.  $\Box$ 

**Proposition** (2.4.3). Let  $f: M \to M'$  be an R-homomorphism.

(a) If  $(P_{\bullet})$  and  $(P'_{\bullet})$  are projective resolutions, then there is a chain map  $g: P \to P'$ . If g and g' are two chain maps between P and P', then g and g' are homotopic.

(b) Same for injective resolution.

*Proof.* (a) Lift f to get  $g_0$ . Restrict to kernel and lift  $g_0$  to get  $g_1$ , and so on.

Restrict to kernel and lift 
$$g_0 - g'_0$$
 to get  $h_0$ 

For an injective resolution I of N, we define  $\operatorname{Ext}^n_R(M,N) := H^n(\operatorname{Hom}_R(M,I^{\bullet}))$ .

For a projective resolution P of M, we define  $\operatorname{Tor}_n^R(M,N) := H_n(P_{\bullet} \otimes_R N)$ .

(For a flat resolution F of M, we define  $\operatorname{Tor}_n^R(M,N) := H_n(F_{\bullet} \otimes_R N)$ ).

They do not depend on the choice of resolutions.

For  $f: M_1 \to M_2$ , we have an induced homomorphism  $\operatorname{Ext}_R^n(M_2, N) \to \operatorname{Ext}_R^n(M_1, N)$ .

For  $f: N_1 \to N_2$ , we have an induced homomorphism  $\operatorname{Tor}_n^R(M, N_1) \to \operatorname{Tor}_n^R(M, N_2)$ .

functoriality.

## 7 Day 7: June 8

**Theorem** (2.4.4). Let  $0 \to M_1 \to M_2 \to M_3 \to 0$  be an exact sequence of R-modules and N be an R-module. Then, there exist long exact sequences

(a)

$$0 \to \operatorname{Hom}_R(M_3, N) \to \operatorname{Hom}_R(M_2, N) \to \operatorname{Hom}_R(M_1, N)$$
  
$$\to \operatorname{Ext}_R^1(M_3, N) \to \operatorname{Ext}_R^1(M_2, N) \to \operatorname{Ext}_R^1(M_1, N)$$
  
$$\to \operatorname{Ext}_R^2(M_3, N) \to \operatorname{Ext}_R^2(M_2, N) \to \operatorname{Ext}_R^2(M_1, N) \to \cdots.$$

(b)

$$\begin{split} 0 &\to \operatorname{Hom}_R(N,M_1) \to \operatorname{Hom}_R(N,M_2) \to \operatorname{Hom}_R(N,M_3) \\ &\to \operatorname{Ext}_R^1(N,M_1) \to \operatorname{Ext}_R^1(N,M_2) \to \operatorname{Ext}_R^1(N,M_3) \\ &\to \operatorname{Ext}_R^2(N,M_1) \to \operatorname{Ext}_R^2(N,M_2) \to \operatorname{Ext}_R^2(N,M_3) \to \cdots. \end{split}$$

(c)

$$\cdots \to \operatorname{Tor}_2^R(M_1,N) \to \operatorname{Tor}_2^R(M_2,N) \to \operatorname{Tor}_2^R(M_3,N) \to$$

$$\operatorname{Tor}_1^R(M_1,N) \to \operatorname{Tor}_1^R(M_2,N) \to \operatorname{Tor}_1^R(M_3,N) \to$$

$$M_1 \otimes_R N \to M_2 \otimes_R N \to M_3 \otimes_R N \to 0.$$

(d)

$$\begin{split} \cdots &\to \operatorname{Tor}_2^R(N,M_1) \to \operatorname{Tor}_2^R(N,M_2) \to \operatorname{Tor}_2^R(N,M_3) \to \\ &\operatorname{Tor}_1^R(N,M_1) \to \operatorname{Tor}_1^R(N,M_2) \to \operatorname{Tor}_1^R(N,M_3) \to \\ &N \otimes_R M_1 \quad \to \quad N \otimes_R M_2 \quad \to \quad N \otimes_R M_3 \to 0. \end{split}$$

*Proof.* (a) For  $N \to I^{\bullet}$  an injective resolution, we have a short exact sequence of cochain complexes

$$0 \to \operatorname{Hom}_R(M_3, I^{\bullet}) \to \operatorname{Hom}_R(M_2, I^{\bullet}) \to \operatorname{Hom}_R(M_1, I^{\bullet}) \to 0.$$

(d) For  $P_{\bullet} \to N$  a projective resolution, since a projective module is flat, we have a short exact sequence of chain complexes

$$0 \to P_{\bullet} \otimes_{R} M_{1} \to P_{\bullet} \otimes_{R} M_{2} \to P_{\bullet} \otimes_{R} M_{3} \to 0.$$

**Theorem** (2.4.5). We have a natural isomorphism  $\operatorname{Ext}_R^n(M,N) = H^n(\operatorname{Hom}_R(P_{\bullet},N))$  for any projective resolution  $P_{\bullet} \to M$ .

Recall that we have to see  $\operatorname{Hom}_R(P_{\bullet}, N)$  as a cochain complex, although the index is placed at lower. The existence of the short exact sequence of cochain complexes

$$0 \to \operatorname{Hom}_R(P_{\bullet}, M_1) \to \operatorname{Hom}_R(P_{\bullet}, M_2) \to \operatorname{Hom}_R(P_{\bullet}, M_3) \to 0$$

implies that  $H^n(\operatorname{Hom}_R(P_{\bullet}, M_i))$  enjoys a long exact sequence.

Let  $C^{\bullet,\bullet}$  and  $D^{\bullet,\bullet}$  be double complexes bounded below with respect to both directions, i.e. there is N such that if  $p \le -N$  or  $q \le -N$  then  $C^{p,q} = D^{p,q} = 0$ , and that  $H^p(C^{\bullet,q}) \xrightarrow{\sim} H^p(D^{\bullet,q})$  for all p and q. Then, we have shown that  $H^n(\text{Tot}(C^{\bullet,\bullet})) \xrightarrow{\sim} H^n(\text{Tot}(D^{\bullet,\bullet}))$  for every n.

#### Proposition.

(a) Let  $C^{\bullet,\bullet}$  be a double complex with  $C^{p,\bullet} = 0$  for p < 0. Let  $A^{\bullet}$  be a cochian complex. Assume  $A^{\bullet}$  and  $C^{p,\bullet}$  are bounded below for every p. Suppose  $\varepsilon : A^{\bullet} \to C^{0,\bullet}$  is a cochain map such that

$$A^q \to C^{0,q} \to C^{1,q} \to \cdots$$

is a resolution for every q. Then,  $H^n(A^{\bullet}) \xrightarrow{\sim} H^n(\operatorname{Tot}(C^{\bullet,\bullet}))$ .

(b) Let  $C^{\bullet, \bullet}$  be a double complex with  $C^{\bullet, q} = 0$  for q < 0. Let  $B^{\bullet}$  be a cochian complex. Assume  $B^{\bullet}$  and  $C^{\bullet, q}$  are bounded below for every q. Suppose  $\varepsilon : B^{\bullet} \to C^{\bullet, 0}$  is a cochain map such that

$$B^p \to C^{p,0} \to C^{p,1} \to \cdots$$

is a resolution for every p. Then,  $H^n(A^{\bullet}) \xrightarrow{\sim} H^n(\text{Tot}(C^{\bullet,\bullet}))$ .

(c) Let  $C_{\bullet,\bullet}$  be a double complex with  $C_{p,\bullet} = 0$  for p < 0. Let  $A_{\bullet}$  be a chian complex. Assume  $A_{\bullet}$  and  $C_{p,\bullet}$  are bounded below for every p. Suppose  $\varepsilon : C_{0,\bullet} \to A_{\bullet}$  is a chain map such that

$$\cdots \rightarrow C_{1,a} \rightarrow C_{0,a} \rightarrow A_a$$

is a resolution for every q. Then,  $H_n(A_{\bullet}) \stackrel{\sim}{\leftarrow} H_n(\operatorname{Tot}(C_{\bullet,\bullet}))$ .

(d) Let  $C_{\bullet,\bullet}$  be a double complex with  $C_{\bullet,q}=0$  for q<0. Let  $B_{\bullet}$  be a chian complex. Assume  $B_{\bullet}$  and  $C_{\bullet,q}$  are bounded below for every q. Suppose  $\varepsilon:C_{\bullet,0}\to B_{\bullet}$  is a chain map such that

$$\cdots \rightarrow C_{p,1} \rightarrow C_{p,0} \rightarrow B_p$$

is a resolution for every p. Then,  $H_n(A_{\bullet}) \stackrel{\sim}{\leftarrow} H_n(\operatorname{Tot}(C_{\bullet, \bullet}))$ .

*Proof.* Inflate  $A^{\bullet}$  to construct  $A^{\bullet,\bullet}$ .

Proof of Theorem 2.4.5. Let  $P_{\bullet} \to M$  and  $N \to I^{\bullet}$  be a projective and an injective resolution respectively. Let  $A^q := \operatorname{Hom}_R(M, I^q)$ ,  $B^p := \operatorname{Hom}_R(P_p, N)$ , and  $C^{p,q} := \operatorname{Hom}_R(P_p, I^q)$ . Since  $H^n(A^{\bullet}) = \operatorname{Ext}_R^n(M, N)$ , enough to show  $H^n(A^{\bullet}) = H^n(B^{\bullet})$ . We can define  $\varepsilon : A^{\bullet} \to C^{0,\bullet}$  and  $\delta : B^{\bullet} \to C^{\bullet,0}$ . Apply the above proposition to obtain  $H^n(A^{\bullet}) = H^n(\operatorname{Tot}(C^{\bullet,\bullet})) = H^n(B^{\bullet})$ .

**Proposition** (2.4.6). Let M be an R-module.

- (a) M is projective  $\iff \operatorname{Ext}_R^n(M,N) = 0 \ \forall n \ \forall N \iff \operatorname{Ext}_R^1(M,N) = 0 \ \forall N$ .
- (b) M is injective  $\iff \operatorname{Ext}^n_R(N,M) = 0 \ \forall n \ \forall N \iff \operatorname{Ext}^1_R(N,M) = 0 \ \forall N.$
- (c) M is flat  $\iff$   $\operatorname{Tor}_{n}^{R}(M, N) = 0 \ \forall n \ \forall N \iff \operatorname{Tor}_{1}^{R}(M, N) = 0 \ \forall N$ .

*Proof.* (a) For  $(1) \Rightarrow (2)$ , use 2.4.5. For  $(3) \Rightarrow (1)$ , use 2.4.4.

Lemma.

- (a)  $\operatorname{Ext}_{R}^{n}(\bigoplus_{\lambda} M_{\lambda}, N) = \prod_{\lambda} \operatorname{Ext}_{R}^{n}(M_{\lambda}, N)$ .
- (b)  $\operatorname{Ext}_{p}^{n}(M, \prod_{\lambda} N_{\lambda}) = \prod_{\lambda} \operatorname{Ext}_{p}^{n}(M, N_{\lambda}).$
- (c)  $\operatorname{Tor}_{n}^{R}(\bigoplus_{\lambda} M_{\lambda}, N) = \bigoplus_{\lambda} \operatorname{Tor}_{n}^{R}(M_{\lambda}, N)$ .
- (d)  $\operatorname{Tor}_{n}^{R}(M, \bigoplus_{\lambda} N_{\lambda}) = \bigoplus_{\lambda} \operatorname{Tor}_{n}^{R}(M, N_{\lambda}).$

**Proposition** (2.4.8). *If* R *is PID, then*  $\operatorname{Ext}_R^n = \operatorname{Tor}_n^R = 0$  *for*  $n \ge 2$ .

*Proof.* (Ext = 0) Embed  $N \hookrightarrow I_0$  into an injective. Then,  $N \to I_0 \to I_1 \to 0$  is an injective resolution because the cokernel  $I_1$  is also injective by the *a*-times map.

(Tor = 0) Consider  $P_0 M$  from a free module. Then,  $P_0$  is torsion-free,  $P_1$  is also torsion-free, so the kernel  $P_1$  is flat. (Or, recall that in PID a module is projective iff free, and that a submodule of a free module is free.)

## Example.

- (a)  $0 \to \mathbb{Z} \to \mathbb{Z} \to \mathbb{Z}/m\mathbb{Z} \to 0$  is a projective resolution of  $\mathbb{Z}/m\mathbb{Z}$ . Then, taking  $\operatorname{Hom}_{\mathbb{Z}}(-,N)$ , we have  $N \xrightarrow{m} N \to 0$ . Thus  $\operatorname{Ext}^n_{\mathbb{Z}}(\mathbb{Z}/m\mathbb{Z}) = H^n(N \xrightarrow{m} N \xrightarrow{0} N)$ ,  $\operatorname{Ext}^1_{\mathbb{Z}}(\mathbb{Z}/m\mathbb{Z}) = N/mN$ .
- (b)  $\operatorname{Tor}_n^{\mathbb{Z}}(\mathbb{Z}, N) = 0$ ,  $\operatorname{Tor}_n^{\mathbb{Z}}(\mathbb{Z}/m, N) = ?$
- (c) Let  $R = \mathbb{Z}/p^2\mathbb{Z}$ . Then we have a projective resolution

$$\xrightarrow{p} \mathbb{Z}/p^2 \xrightarrow{p} \mathbb{Z}/p^2 \xrightarrow{p} \mathbb{Z}/p^2 \to \mathbb{Z}/p^2 \to 0.$$

Thus  $\operatorname{Tor}_n^{\mathbb{Z}/p^2}(\mathbb{Z}/p,\mathbb{Z}/p) \cong \mathbb{Z}/p$  for  $n \geq 0$ . Then,  $\operatorname{Ext}_{\mathbb{Z}/p^2}^n(\mathbb{Z}/p,\mathbb{Z}/p) = ?$ 

(d) Let R = k[x, y] and N = R/(x, y). Then,

$$0 \to R \xrightarrow{h \to (yh, -xh)} R^{\oplus 2} \xrightarrow{(f,g) \mapsto xf - yg} R \to N \to 0$$

is a projective resolution,

$$\operatorname{Ext}_{R}^{n}(N,N) = \begin{cases} N & n = 0 \\ N^{\oplus 2} & n = 1 \\ N & n = 2 \\ 0 & n \ge 3. \end{cases}$$
