## Part I

# **Hopf** \*-algebras

#### 1.1

Multiplier Hopf \*-algebras
Algebraic quantum groups
Hopf C\*-algebras
idempotent ring assumption

## Locally compact groups

#### 2.1

- **2.1** (Non- $\sigma$ -finite measures). Following technical issues are important
  - (a) The Fubini theorem
  - (b) The Radon-Nikodym theorem
  - (c) The dual space of  $L^1$  space
- 2.2 (Existence of the Haar measure).
- 2.3 (Left and right uniformities).
- 2.4 (Modular functions).
- **2.5** (Uniformly continuous functions). G acts on  $C_{lu}(G)$  and  $L^1(G)$  continuously with respect to the point-norm topology. A function on G is left uniformly continuous if and only if it is written as f \* x for some  $f \in L^1(G)$  and  $x \in L^\infty(G)$ .  $g \in C_c(G)$  is two-sided uniformly continuous.
- **2.6** (Structures on a locally compact group). For a locally compact group G, consider  $A := C_c(G)$ . It is a left Hilbert algebra by the existence of the left Haar measure

$$(f*g)(s) := \int f(t)g(t^{-1}s)dt, \qquad \langle f,g \rangle := \int \overline{g(s)}f(s)ds, \qquad f^{\sharp}(s) := \delta(s^{-1})\overline{f(s^{-1})}.$$

and is a commutative counital multiplier Hopf \*-algebra by the group structure.

$$(fg)(s) := f(s)g(s), \qquad \Delta f(s,t) = f(st), \qquad f^*(s) := \overline{f(s)}, \qquad Sf(s) = f(s^{-1}).$$

Since the image of the comultiplication does not belong to  $C_c(G) \otimes C_c(G)$ , we need to do something unless G is finite. They satisfy a compatibility condition  $\langle f g, h \rangle = \langle f, g^*h \rangle$ .

With the integral notation  $f = \int f(s)\lambda_s ds$ , we can write

For multipliers, intuitively

We start from this structures.

From now on, we are going to exclude any measure theory and the theory of non-commutative  $L^p$  spaces. First, we have the completion  $H =: L^2(G)$ . Consider two representations

$$\lambda: (C_c(G), *, ^{\sharp}) \rightarrow B(L^2(G)), \qquad m: (C_c(G), \cdot, ^{\ast}) \rightarrow B(L^2(G)).$$

- (a)  $\lambda$  is well-defined.
- (b) *m* is well-defined.

*Proof.* The multiplication representation m is well-defined because for  $f \in C_c(G)$  we have  $f^*f \in C_c(G) \subset L^2(G)$  so

$$||m(f)g||^2 = \langle fg, fg \rangle = \langle f^*fg, g \rangle, \qquad g \in C_c(G).$$

#### 2.2

**2.7** (Left convolution algebra  $L^1(G)$ ). Let G be a locally compact group. The representation m defines the von Neumann algebra  $m(C_c(G))'' =: L^{\infty}(G)$  and its predual  $L^1(G)$ .

- (a) There is a natural injection  $C_c(G) \to L^1(G)$ .
- (b) There is a natural Banach \*-algebra structure on  $L^1(G)$  extended from the Hilbert algebra structure of  $C_c(G)$ .
- (c) The Banach algebra  $L^1(G)$  has a two-sided approximate unit.
- (d)  $\alpha: G \to \operatorname{Aut}(L^1(G))$  is point-norm continuous.
- (e)  $\lambda: G \to U(L^2(G))$  and  $\lambda: L^1(G) \to B(L^2(G))$  are strongly continuous.
- (f) Convolution inequalities.
- (g) Representation theory equivalence.

*Proof.* Let  $(U_{\alpha})$  be a directed set of open neighborhoods of the identity e of G. By Urysohn lemma, there is  $e_{\alpha} \in C_c(U)^+$  such that  $||e_{\alpha}||_1 = 1$  for each  $\alpha$ . We claim that  $e_{\alpha}$  is a two-sided approximate unit for  $L^1(G)$ . Suppose  $g \in C_c(G)$ , which is two-sided uniformly continuous. For any  $\varepsilon > 0$ , take  $\alpha_0$  such that  $||g - \lambda_s g|| < \varepsilon$  and  $||g - \rho_s g|| < \varepsilon$  for all  $s \in U_{\alpha}$  for  $\alpha > \alpha_0$ . Then, we have

$$||e_{\alpha} * g - g||_{1} = \int |e_{\alpha} * g(t) - g(t)| dt \le \iint e_{\alpha}(s) |g(s^{-1}t) - g(t)| ds dt$$

$$= \int_{U_{\alpha}} e_{\alpha}(s) ||\lambda_{s}g - g||_{1} ds < \varepsilon \int e_{\alpha}(s) ds \le \varepsilon,$$

and

$$\begin{split} \|g*e_{\alpha}-g\|_{1} &= \int |g*e_{\alpha}(s)-g(s)| \, ds \leq \iint |g(t)-g(s)| e_{\alpha}(t^{-1}s) \, dt \, ds \\ &= \iint |g(t)-g(ts)| e_{\alpha}(s) \, dt \, ds = \int \|g-\rho_{s}g\|_{1} e_{\alpha}(s) \, ds < \varepsilon \int e_{\alpha}(s) \, ds \leq \varepsilon, \end{split}$$

and they imply  $\lim_{\alpha} \|e_{\alpha} * g - g\|_1 = \lim_{\alpha} \|g * e_{\alpha} - g\|_1 = 0$ . We can approximate  $f \in L^1(G)$  with compactly supported continuous functions by the  $\varepsilon/3$  argument.

Note that we have

$$\begin{split} |\langle \lambda(\xi)\eta, \zeta \rangle|^2 &= |\int \int \xi(t)\eta(t^{-1}s)\overline{\zeta(s)} \, ds \, dt|^2 \\ &\leq \int \int |\xi(t)||\eta(t^{-1}s)|^2 \, ds \, dt \cdot \int \int |\xi(t)||\zeta(s)|^2 \, ds \, dt \\ &= ||\xi||_1^2 ||\eta||_2^2 ||\zeta||_2^2 \end{split}$$

and

$$\begin{aligned} |\langle \rho(\xi)\eta, \zeta \rangle|^2 &= | \iint \eta(t)\xi(t^{-1}s)\overline{\zeta(s)} \, ds \, dt |^2 \\ &\leq \iint |\xi(t^{-1}s)||\eta(t)|^2 \, ds \, dt \cdot \iint |\xi(t^{-1}s)||\zeta(s)|^2 \, ds \, dt \\ &= \|\xi\|_1 \|F\xi\|_1 \|\eta\|_2^2 \|\zeta\|_2^2 \end{aligned}$$

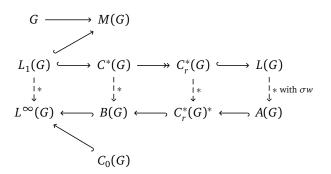

imply

$$\|\lambda(\xi)\|_{2\to 2} \le \|\xi\|_1, \qquad \|\rho(\xi)\|_{2\to 2} \le \sqrt{\|\xi\|_1 \|F\xi\|_1}.$$

The equalities do not hold, consider  $\|\lambda(\xi)\| = \|\hat{\xi}\|_{\infty}$  if  $G = \mathbb{R}$ .

**2.8** (Group 
$$C^*$$
-algebras).  $\overline{\lambda(C_c(G))} =: C_r^*(G), \overline{m(C_c(G))} =: C_0(G).$ 

- 2.9 (Fell absorption principle). Structure operator
- **2.10** (Fourier algebra). The Fourier algebra is H \* SH =: A(G).
- 2.11 (Fourier-Stieltjes algebra). positive definite functions, Bochner theorem
- **2.12** (GNS construction for locally compact groups). Let G be a locally compact group. By a state of  $C^*(G)$ , we could construct the GNS representation of G. An analog of GNS construction for  $L^1(G)$  without completion is doable, when given a function of positive type on G, instead of a state.

#### 2.3 Pontryagin duality

- **2.13** (Locally compact abelian groups). Let G be a locally compacy abelian group. Then, we can consider the intersection of  $L^2$  and  $L^\infty$  via  $A' =: \mathcal{F}^{-1}(L^2(G) \cap L^\infty(G))$ .
- 2.14 (Dual group).
- 2.15 (Fourier inversion theorem).
- 2.16 (Plancherel's theorem).

#### 2.4 Structure theorems

#### 2.5 Spectral synthesis

- **2.17** (Compact groups). Let *G* be a compact group. Then,  $C_c(G) = C(G)$  is a Hopf  $C^*$ -algebra.
- **2.18** (Discrete groups). Let G be a discrete group. Then,  $C_c(G)$  is a unital left Hilbert algebra.

# Part II Topological quantum groups
