# Part I Fourier analysis

## Fourier series

#### 1.1 Fourier series in $L^p$ spaces

1.1.

$$\|\widehat{f}\|_{\ell^1(\mathbb{Z})} \lesssim \|f\|_{W^{1,1+\varepsilon}(\mathbb{T})}.$$

Inversion theorem is an approximation problem given by  $\mathcal{F}^*\mathcal{F}=\lim_{n\to\infty}\mathcal{F}_n^*\mathcal{F}$ . The condition  $\widehat{f}\in \ell^1(\mathbb{Z})$  is a condition just for defining  $\mathcal{F}^*\widehat{f}$  without using distribution theory, and it does not affect the inversion phenomena. The approximation, in other words, can be seen as an extension method for  $\mathcal{F}^*:\ell^1(\mathbb{Z})\to C(\mathbb{T})$  on  $c_0(\mathbb{Z})$ . Note that  $\mathcal{F}_n^*$  on  $c_0(\mathbb{Z})$  cannot be bounded directly without distribution theory, but  $\mathcal{F}_n^*\mathcal{F}$  on  $L^p(\mathbb{T})$  can be bounded well.

#### 1.2 Summability methods

- If  $\mathcal{F}_n^*$  is the standard partial sum, then  $\mathcal{F}_n^*\mathcal{F}$  is the Dirichlet kernel.
- If  $\mathcal{F}_n^*$  is the Cesàro mean, then  $\mathcal{F}_n^*\mathcal{F}$  is the Fejér kernel.
- If  $\mathcal{F}_r^*$  is the Abel sum, then  $\mathcal{F}_r^*\mathcal{F}$  is the Poisson kernel.
- In Fourier transform, we often use the Gauss-Weierstrass kernel.

The injectivity of  $\mathcal{F}$  is not an easy problem, which comes from the inversion theorem.

**1.2** (Dirichlet kernel). The *Dirichlet kernel* is a function  $D_n: \mathbf{T} \to \mathbb{R}$  defined by

$$D_n = \widehat{\mathbf{1}_{|k| \le n}}$$
, or equivalently,  $\widehat{D_n} = \mathbf{1}_{|k| \le n}$ .

This is because they are invariant under inverse, in other words, they are even.

 $D_n(x) = \frac{\sin\frac{2n+1}{2}x}{\sin\frac{1}{2}x}.$ 

(b) If  $f \in \text{Lip}(\mathbf{T})$ , then  $D_n * f \to f$  pointwisely as  $n \to \infty$ .

(c)  $||D_n||_{L^1(\mathbf{T})} \gtrsim \log n.$ 

Proof.

$$D_n(x) = \sum_{k=-n}^{n} e^{ikx}$$

$$= \frac{e^{i\frac{2n+1}{2}x} - e^{-i\frac{2n+1}{2}x}}{e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}}$$

$$= \frac{\sin\frac{2n+1}{2}x}{\sin\frac{1}{2}x}.$$

(c) By (2)  $\sin x \le x$  for  $x \in [0, \pi/2]$ , (3) change of variable,

$$||D_n||_{L^1(\mathbf{T})} = \frac{1}{2\pi} \int_{-\pi}^{\pi} |\frac{\sin\frac{2n+1}{2}x}{\sin\frac{1}{2}x}| dx$$

$$\geq \frac{2}{\pi} \int_{0}^{\pi} \frac{|\sin\frac{2n+1}{2}x|}{x} dx$$

$$= \frac{2}{\pi} \int_{0}^{\frac{2n+1}{2}\pi} \frac{|\sin x|}{x} dx$$

$$= \frac{2}{\pi} \sum_{k=0}^{2n} \int_{\frac{k}{2}\pi}^{\frac{k+1}{2}\pi} \frac{|\sin x|}{x} dx$$

$$\geq \frac{2}{\pi} \sum_{k=0}^{2n} \int_{0}^{\frac{1}{2}\pi} \frac{\sin x}{\frac{k+1}{2}\pi} dx$$

$$\geq \frac{4}{\pi^2} \sum_{k=0}^{2n} \frac{1}{1+k}$$

$$\geq \frac{4}{\pi^2} \log(2n+2).$$

..?

**1.3** (Fejér kernel). The Fejér kernel is

(a)

$$K_n(x) = \frac{1}{n+1} \frac{\sin^2 \frac{n+1}{2} x}{\sin^2 \frac{1}{2} x}.$$

Proof. Since

$$\begin{split} D_n(x) &= \frac{e^{i\frac{2n+1}{2}x} - e^{-i\frac{2n+1}{2}x}}{e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}} \\ &= \frac{\left[e^{i\frac{2n+1}{2}x} - e^{-i\frac{2n+1}{2}x}\right]\left[e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}\right]}{\left[e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}\right]^2} \\ &= \frac{\left[e^{i(n+1)x} + e^{-i(n+1)x}\right] - \left[e^{inx} + e^{-inx}\right]}{\left[e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}\right]^2}, \end{split}$$

by telescoping, we get

$$\begin{split} \sum_{k=0}^{n} D_k(x) &= \frac{\left[e^{i(n+1)x} + e^{-i(n+1)x}\right] - \left[e^{i0x} + e^{-i0x}\right]}{\left[e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}\right]^2} \\ &= \frac{\left[e^{i\frac{n+1}{2}x} - e^{-i\frac{n+1}{2}x}\right]^2}{\left[e^{i\frac{1}{2}x} - e^{-i\frac{1}{2}x}\right]^2} \\ &= \frac{\sin^2\frac{n+1}{2}x}{\sin^2\frac{1}{2}x}. \end{split}$$

Two important results from Fejér kernel:

- 1. If f(x-), f(x+) exist and  $S_n f(x)$  converges, then  $S_n f(x) \to \frac{1}{2} (f(x-) + f(x+))$ .
- 2. (If  $f \in L^1(\mathbf{T})$ , then  $\sigma_n f \to f$  a.e.)
- 3. If  $f \in L^1(\mathbf{T})$ , then  $S_n f \to f$  in  $L^1$  and  $L^2$ .
- 4. If f is continuous and  $\hat{f} \in L^1(\mathbb{Z})$ , then  $S_n f \to f$  uniformly.
- 5. Since  $\sigma_n f$  is a trigonometric polynomial, the set of trigonometric polynomials are dense in  $L^1(\mathbf{T})$  and  $L^2(\mathbf{T})$ .

### 1.3 Pointwise convergence of Fourier series

BV function: Dini, Jordan's criterion

1.4 (Riemann localization principle).

#### **Exercises**

1.5 (Gibbs phenomenon).

1.6 (Du Bois-Reymond function).

## Fourier transform

#### 2.1 Fourier transform in $L^p$ space

2.1 (Riemann-Lebesgue lemma).

Lp extension

Gaussian function computation: differential equation method, contour integral method inversion theorem

2.2 (Plancherel theorem).

#### 2.2 Distributions

2.3 (Cauchy principal value). indented contour, imaginary shift, Feynman's trick

#### **Exercises**

2.4 (Sampling theorem).

$$\mathcal{F}\mathbf{1}_{[-\frac{1}{2},\frac{1}{2}]}(\xi) = \operatorname{sinc}(\xi/2)$$

 $\operatorname{sinc} \in L^{1+\varepsilon}(\mathbb{R}).$ 

2.5 (Poisson summation formula).

2.6 (Uncertainty principle).

**2.7** (Multipole expansion). Let  $\rho$  be a compactly supported distribution on  $\mathbb{R}^d$ . We want to investigate the limit behavior of  $\rho(\varepsilon^{-1}x)$  as  $\varepsilon \to 0$ . More precisely, we want to compute an integer  $k \ge d$  such that  $\lim_{\varepsilon \to 0+} \varepsilon^{-k} \rho(\varepsilon^{-1}x)$  defines a distribution supported at  $\{0\}$ , and the coefficients of derivatives of Dirac measures.

We need to introduce quantities called monopole, dipole, quadrapole, octupole, etc.

(a) A distribution supported on {0} is a linear combination of the Dirac measure and its derivatives.

(b)

## **Problems**

1. Find all 
$$\alpha > 0$$
 such that

$$\lim_{x \to \infty} x^{-\alpha} \int_0^x f(y) \, dy = 0$$

for all 
$$f \in L^3([0,\infty))$$
.

## Hilbert transform

- 3.1 Harmonic conjugate
- 3.2 Kernel representation
- **3.3** Fourier series in  $L^p$  space

# Part II Singular integral operators

## Calderón-Zygmund theory

#### 4.1 Convolution type operators

**4.1** (Calderón-Zygmund decomposition of sets). Let  $f \in L^1(\mathbb{R}^d)$ . Let  $E_n f$  be the conditional expectation with repect to the  $\sigma$ -algebra generated by dyadic cubes with side length  $2^{-n}$ . Let  $Mf := \sup_n E_n |f|$  be the maximal function, and let  $\Omega := \{x : Mf(x) > \lambda\}$  for fixed  $\lambda > 0$ . For  $x \in \Omega$  let  $Q_x$  be the maximal dyadic cube such that  $x \in Q_x$  and

$$\frac{1}{|Q_x|} \int_{Q_x} |f| > \lambda.$$

- (a)  $\{Q_x : x \in \Omega\}$  is a countable partition of  $\Omega$ .
- (b) We have an weak type estimate  $|\Omega| \leq \frac{1}{\lambda} ||f||_{L^1}$ .
- (c)  $||f||_{L^{\infty}(\mathbb{R}^d\setminus\Omega)} \leq \lambda$ .
- (d) For  $x \in \Omega$

$$\frac{1}{|Q_x|} \int_{Q_x} |f| \le 2^d \lambda.$$

4.2 (Calderón-Zygmund decomposition of functions). Let

$$g(x) := \begin{cases} |f(x)| & , x \notin \Omega \\ \frac{1}{|Q_x|} \int_{Q_x} |f| & , x \in \Omega \end{cases}$$

and  $b_i := (|f| - g)\chi_{Q_i}$  so that |f| = g + b where  $b = \sum_i b_i$ .

- (a)  $||g||_{L^1} = ||f||_{L^1}$  and  $||g||_{L^\infty} \lesssim_d \lambda$ .
- (b)  $||b||_{L^1} \le 2||f||_{L^1}$  and  $\int b_i = 0$ .

Proof.

- **4.3** ( $L^p$  boundedness of Calderón-Zygmund operators). Let  $T: C_c^{\infty}(\mathbb{R}^d) \to \mathcal{D}'(\mathbb{R}^d)$  be a *singular integral operator of convolution type* in the sense that there is a function  $K \in L^1_{loc}(\mathbb{R}^d \setminus \{0\}) \cap \mathcal{D}'(\mathbb{R}^d)$  such that Tf(x) = K \* f(x) for all  $f \in \mathcal{D}(\mathbb{R}^d)$ , whenever  $x \notin \text{supp } f$ . We say T is called a *Calderón-Zygmund* operator if
  - (i) T is  $L^2$ -bounded: we have

$$||Tf||_{L^2} \lesssim ||f||_{L^2},$$

(ii) T satisfies the Hörmander condition: we have

$$\int_{|x|>2|y|} |K(x-y)-K(x)| \, dx \lesssim 1$$

for every y > 0.

Let  $f=g+b=g+\sum_i b_i$  be the Calderón-Zygmund decomposition, and let  $\Omega^*:=\bigcup_i Q_i^*$  where  $Q_i^*$  is the cube with the same center as  $Q_i$  and whose sides are  $2\sqrt{d}$  times longer.

(a) The  $L^2$ -boundedness implies

$$|\{x: |Tg(x)| > \frac{\lambda}{2}\}| \lesssim_d \frac{1}{\lambda} ||f||_{L^1}.$$

(b) The Hörmander condition implies

$$|\{x: |Tb(x)| > \frac{\lambda}{2}\} \setminus \Omega^*| \lesssim_d \frac{1}{\lambda} ||f||_{L^1}.$$

(c)

Proof. (a) Using the Chebyshev inequality and the Hölder inequality,

$$|\{x: |Tg(x)| > \frac{\lambda}{2}\}| \le \frac{4}{\lambda^2} ||Tg||_{L^2(\Omega)}^2 \le \frac{4C}{\lambda^2} ||g||_{L^2(\Omega)}^2 \le \frac{4C}{\lambda^2} ||g||_{L^1(\Omega)} ||g||_{L^\infty(\Omega)}.$$

(b) Write

$$|\{x: |Tb(x)| > \frac{\lambda}{2}\} \setminus \Omega^*| \le \frac{2}{\lambda} \int_{\mathbb{R}^d \setminus \Omega^*} |Tb(x)| \, dx \le \frac{2}{\lambda} \sum_i \int_{\mathbb{R}^d \setminus \Omega^*} |Tb_i(x)| \, dx.$$

Since  $x \in \mathbb{R}^d \setminus Q_i^*$  does not belong to supp  $b_i \subset Q_i$  and  $\int b_i = 0$ , we have

$$Tb_{i}(x) = \int_{Q_{i}} K(x - y)b_{i}(y) dy = \int_{Q_{i}} [K(x - y) - K(x)]b_{i}(y) dy,$$

and

$$\int_{\mathbb{R}^d \setminus Q_i^*} |Tb_i(x)| \, dx = \int_{Q_i} |b_i(y)| \int_{\mathbb{R}^d \setminus Q_i^*} |K(x-y) - K(x)| \, dx \, dy \lesssim \|b_i\|_{L^1}.$$

(We need to show it is valid even though  $b_i$  is not smooth)

(c)

4.4 (Hölder boundedness of Calderón-Zygmund operators).

#### 4.2 Truncated integrals

Homogeneous kernels

### 4.3 $A_p$ weights

#### 4.4 Bounded mean oscillation

#### **Exercises**

**4.5** (Size and cancellation condition). Let  $K \in L^1_{loc}(\mathbb{R}^d \setminus \{0\}) \cap \mathcal{D}'(\mathbb{R}^d)$ . We say the condition  $|K(x)| \lesssim |x|^{-d}$  for  $x \neq 0$  as the *size condition*, and say the condition  $\int_{r < |x| < R} K(x) \, dx = 0$  for all  $0 < r < R < \infty$  as the *cancellation condition*. If K satisfies the size, cancellation, and Hörmander condition, then it is  $L^2$  bounded, hence Calderón-Zygmund.

**4.6** (Gradient size condition). Let  $|\nabla K(x)| \lesssim |x|^{-d-1}$  for  $x \neq 0$ . Then, convolution with K is a Calderón-Zygmund operator.

4.7 (Riesz potential).

### 10.1 Kohn-Nirenberg calculus

 $S_{\rho,\delta}^m$ 

$$|D_x^\alpha D_\xi^\beta a(x,\xi)| \lesssim \langle \xi \rangle^{m-\rho|\beta|+\delta|\alpha|}.$$

Let a be a symbol on  $M = \mathbb{R}^d_x \times \mathbb{R}^d_\xi$ . Then, the associated  $\Psi DO$  is

$$T_a\psi(x):=\frac{1}{(2\pi)^d}\int\int e^{i\langle x-y,\xi\rangle}a(x,\xi)\psi(y)\,dy\,d\xi.$$

For parameters  $0 \le \lambda \le 1$  and h > 0, let

$$\widehat{a}\psi(x) := \frac{1}{(2\pi h)^d} \iint e^{\frac{i}{h}\langle x-y,\xi\rangle} a((1-\lambda)x + \lambda y,\xi)\psi(y) \, dy \, d\xi.$$

For example, regardless of h and  $\lambda$ ,

$$\hat{\xi}\psi(x) = \frac{h}{i}\psi'(x)$$

and

$$\hat{H}\psi(x) = -h^2 \Delta \psi(x) + V(x)\psi(x),$$

where  $V: \mathbb{R}^d_x \times \mathbb{R}^d_\xi \to \mathbb{R}$  and  $H: \mathbb{R}^d_x \times \mathbb{R}^d_\xi \to \mathbb{R}$  such that

$$H(x, \xi) := |\xi|^2 + V(x).$$

$$\frac{d}{dt}a(t) = \{a(t), H\} = X_H a(t)$$

$$\frac{d}{dt}\hat{a}(t) = \frac{d}{dt}e^{\frac{i}{\hbar}t\hat{H}}\hat{a}e^{-\frac{i}{\hbar}t\hat{H}} = -\frac{i}{\hbar}[\hat{a}(t),\hat{H}]$$
